FINALISED CH04 DIAMOND DRILL RESULTS FROM DONG MAO HUO

LONDON – 7 December 2007 – Central China Goldfields plc (AIM: GGG) is pleased to announce it has now received the missing three gold assays and the complete base metal assay results for hole CH04 at Dong Mao Huo.

Highlight:

- Diamond drill hole CH04 returned 45.7 metres from 107.5 metres at 2.71 g/t gold., 0.43% copper and 19.82 g/t silver

These results complete the samples for diamond drill hole CH04 and indicate the potential for elevated gold and base metals on the Dong Mao Huo near surface gold property.

Jeff Malaihollo, Managing Director of Central China Goldfields plc, comments:

“The gold assays remain the company’s main economic focus on the Dong Mao Huo near surface gold property but the presence of both copper, silver and trace zinc indicate that the project needs more exploration to understand its full potential. Further assays will be released as they are received.”

Technical information in Company news releases has been reviewed and approved by Dr. Jeffrey Malaihollo. He holds a BA and PhD in Geological Sciences and is a Fellow of the Geological Society.
